## Flat-Bottom Fittings

## Super Flangeless™ Fittings

- Designed to hold to higher pressures than standard flangeless fittings
- ▶ Eliminates loosening of nuts caused by tubing twist

The design of the Super Flangeless fitting system includes a two-piece ferrule with a lock ring which operates as a bearing against the nut. The nut can then spin freely without turning the ferrule while rotating, preventing the tubing from twisting during the tightening process. This feature helps eliminate subsequent loosening of the nut, making the Super Flangeless system ideal for applications subject to vibration. These products are also well suited for connections that need to be broken frequently, since the lock ring holds the ferrule in place on the tubing until intentionally removed. Use the LT-300 Removal Tool – found on page 33 – to release Super Flangeless Ferrules from tubing for repositioning.

The fittings systems on this page connect 1/16" OD tubing into any flatbottom 6-40, 6-32 or 10-32 flat-bottom port. Use the FEP NanoTight™ Sleeves from page 19 with these fittings to connect capillary tubing with OD sizes between 70  $\mu$ m and 1 mm. Choose from a variety of nut styles for the 10-32 nuts, depending on the application. The headless 6-40 and 6-32 nuts can be tightened using the N-290 extender tool found on page 33.
